Abstract

The role of antibiotic therapy in managing acute bacterial sinusitis (ABS) in children is controversial. The purpose of this study was to determine the effectiveness of the drug called Soandso. This was a randomized, double-blind, placebo-controlled study. Children receiving the antibiotic were more likely to be cured (50% vs 14%). ABS is a common complication of viral upper respiratory infections. Soandso results in significantly more cures and fewer failures than placebo.

1 Introduction

Here we introduce our research..

2 Methods

For our study we use a sample size of 1500 participants.
