

Using PSTricks with pdflatex on Overleaf

Overleaf

April 21, 2022

Solution 1 (Recommended): Compile with XeLaTeX. You can switch to XeLaTeX from the Overleaf project: see this help page too.

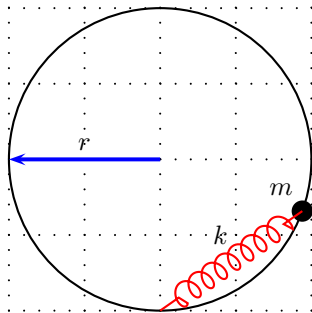

Solution 2: Use the `auto-pst-pdf` package **together with** a custom `latexmkrc` file that contains this line:

```
$hash_calc_ignore_pattern{'pdf'} = '^/(CreationDate|ModDate|ID) ';
```

You will also need to add this line before your `\documentclass`:

```
\def\jobname{main} % or whatever your main document .tex file is named!
```

This is a PSTricks drawing:

Here's a JPG picture to prove we're *not* using the LaTeX+dvipdf engine!
